Reverse transcription-quantitative polymerase chain reaction (RT-qPCR)

Total RNA was extracted from the tissues and cells using TRIzol reagent (Sigma-Aldrich, Shanghai, China) and reverse transcribed to cDNA using cDNA synthesis kit (Vazyme, Nanjing, China). Gene expression was detected using the Roche LightCycler 96 system (Roche, Switzerland). The primer sequences used in this study were as follows: *PHGDH*, forward: 5'- CTGCGGAAAGTGCTCATCAGT -3', reverse: 5'- TGGCAGAGCGAACAATAAGGC -3'; *Bcl-2*, forward: 5'- GGTGGGGTCATGTGTGTGG -3', reverse: 5'- CGGTTCAGGTACTIONCAGTCATCC -3'; *Bax*, forward: 5'- CCCGAGAGGTCTTTTTCCGAG-3', reverse: 5'- CCAGCCCATGATGGTTCTGAT -3'; β -actin forward: 5'- CAACCGCGAGAAGATGACC -3', reverse: 5'- ATCACGATGCCAGTGGTACG -3'. The relative expression level of genes was normalized to that of β -actin using the $2^{-\Delta\Delta Ct}$ method.

Supplementary figure

Fig. S1 The mRNA transcription levels of *PHGDH*(A), *Bcl2*(B), and *Bax*(C) were measured after *PHGDH* silence by *PHGDH* siRNA.
