

Supplementary histopathological assessment and IHC

The 4-mm-thick sections of formalin-fixed paraffin-embedded representative PCa tissue blocks were deparaffinized in a series of xylene and hydrated in a graded series of ethanol solutions. Heat-mediated antigen retrieval was performed in 10 mM Tris/EDTA buffer solution (pH 7.0) at 100°C for 20 min. Endogenous peroxidase was quenched with 3% hydrogen peroxide for 15 min at 37°C, and nonspecific binding was blocked with 10% normal goat serum for 1 h at room temperature. Sections were then incubated with primary antibody (dilution in Leica antibody diluent) at 37°C for 30 min. Chromogenic detection was carried out using a peroxidase-conjugated secondary antibody (30 min) and DAB reagents (5 min). Tissue sections were counterstained with 0.1% hematoxylin.

Supplementary Figure 1 – Representative immunohistochemical staining of human placenta tissues and tonsil tissues for PD-1 and PD-L1 antibody respectively.

Supplementary Figure 2 – LNCaP and 22Rv1 cells were transfected with siRNAs (si1, si2) targeting the PD-L1, negative control siRNA (si-NC) and no siRNA controls. Equal loading was identified by probing for GAPDH. Western blot analysis of LNCaP and 22Rv1 cells using PD-L1 monoclonal antibody ABM4E54.

Table – The IHC staining intensity score of PDL1 and PD1 of each patient

Patient ID

PD1

PDL1

Patient ID	percentage of weak stained cells	percentage of moderate stained cells	percentage of strong stained cells	staining intensity score	percentage of weak stained cells	percentage of moderate stained cells	percentage of strong stained cells	staining intensity score
