GSE146895	12	Integrated analysis of long non-coding RNAs expression profiles in THP-1 induced M0, M1 and M2 macrophage and GCC culture medium induced similar M2 (CM-sM2)	To screen for the functional lncRNAs involved in macrophages polarization, total RNA from THP-1 induced M0, M1, M2 and CM-sM2 cells were extracted and analyzed, we employed SBC-lncRNA (human 4*180K) microarray as a discovery platform to identify genes. [M0 were induced by PMA (50ng/ml) for 48h, M1 were induced by LPS (100ng/ml) and IFN- γ (20ng/ml) for 48h and M2 were induced by IL-4 (20ng/ml) for 48h both on the basis of M0. CM-sM2 were induced by 30% culture medium of gastric cancer cells on the	No citation
GSE65801	64	Characterization of differentially expressed genes involved in pathways associated with gastric cancer	To explore the patterns of gene expression in gastric cancer, a total of 32 paired gastric cancer and noncancerous tissues from patients were collected for gene expression microarray analyses. Limma methods were applied to analyze the data, and genes were considered to be significantly differentially expressed if the False Discovery Rate (FDR) values < 0.01, P-value < 0.01 and the fold change >2. Subsequently, Gene Ontology (GO) analysis was used to analyze the main functions of the differentially expressed genes. According to the Kyoto Encyclopedia of Genes and Genomes (KEGG) database, we found pathways significantly associated with the differential genes. Gene-Act network and Co-Expression networks were built respectively based on the relationships among the genes, proteins and compounds in the database. There were 2371 differential mRNAs and 350 differential lncRNAs in our microarray data. The GO categories, pathway analyses and the Gene-Act network showed a consistent result that up-regulated genes were involved in tumorigenesis, migration, angiogenesis and microenvironment formation, while down-regulated genes were involved in metabolism. The results of this study provide some novel findings on genes, pathways and the co-expression network in	[32]

GSE84787	20	Human gastric cancer_Tumor samples_Paired normal samples_10 replicates	To identify the lncRNA profiles of gastric cancer samples, we performed microarray analysis using tumor samples and paired normal samples. 66 lncRNAs were statistically dysregulated more than 2-fold.	[33]
GSE103236	19	Microarray gene expression analysis for early and advanced gastric adenocarcinoma vs normal adjacent tissue.	The study aimed to understand gradual biological variations during gastric tumorigenesis, and to identify the candidate genes that are involved in tumor progression and metastasis. cDNA microarray data were obtained from 10 pair of cancerous and normal adjacent tissue from gastric adenocarcinoma patients. As a results, we found that 136 genes were up-regulated and 96 genes were down-regulated by at least four-fold in tumor tissue. The analysis of gene clusters revealed a complex remodelling of normal gastric epithelium morphology and function associated with the tumorigenesis and metastasis. A large number of proteases are being overexpressed, together with keratins, genes associated with morphogenesis and anti-apoptosis. Between the most significant down-regulated genes, were genes involved gastric motility and synthesis, genes related to metabolic and pro-apoptotic processes. We report also, the identification of seven genes, significant up-regulated, that seems to be associated with tumor progression: KRT17, COL10A1, KIAA1199, SPP1, IL11, S100A2, and MMP3. Conclusions. Our cDNA microarray study identified several genes that appeared to meet the criteria of a good biomarker, and may therefore be	[34]
GSE70394	6	Gene expression profiling of gastric cells infected by Helicobacter pylori	The human gastric carcinoma-derived cell line AGS was infected with H. pylori strain 60190 (ATCC 49503) for 24 hours. RNA was extracted from three independent	[35]

GSE21328	4	Transcriptome analysis of highly metastatic cell line	<p>A prediction of peritoneal recurrence is of significance using metastasis-related biomarker. This work describes a combined analysis of proteome and transcriptome data for biomarker discovery in highly metastatic cell line. We used nano-flow liquid chromatography (LC) linear ion trap time-of-flight mass spectrometry (LIT-TOF MS) and cDNA microarray to identify specific protein differentially expressed between a highly metastatic stomach cancer cell line MKN-45-P and its parental cell line MKN-45. In total, 240 proteins were found to be expressed between the two cell lines. Of these, 75 proteins (31%) and 49 proteins (20%) were only identified from MKN-45-P and MKN-45 respectively. An mRNA expression of 1533 genes was up-regulated in MKN-45-P compared with MKN-45. No close correlation was found between proteomic and transcriptomic analysis. Interestingly, 4</p>	[36]
